My scripts throw so many errors it's impossible to tell which ones are the most important. Is there a way to have PHP keep a count of errors in a text file? A: I'm going to give the answer to this question based on what I've used myself on PHP.NET. It is, however, very much a subjective answer. As just what you might want to do, you can use the PHP error handler to put in place of the standard error handler. I don't believe it has support for checking for more than one error. Since errors are more likely to be off-putting to users, I'd suggest sending an email when an error is encountered. You can use the SMTP error handler in PHP.NET for this. As for what you can do, you could have a PHP script running that has an error handler that will log errors to a file. This is a simpler script that can be run manually to check for errors. The script (if it is robust) should be adapted to work as a daemon running in the background. You should also take a look at how it can be integrated into a web page. Here are a couple of links to show how to set up the error handler: And here are some links that might help as far as how to implement a daemon (i.e. you run this daemon from the CLI in the background after every page load): Fuel cells, which have been attracting attention as a new energy source in recent years, have a characteristic that they generate electric power with high efficiency without producing carbon dioxide, because they directly convert the chemical energy of fuel to electrical energy. One such fuel cell is known to include a membrane electrode assembly including an anode, a cathode, and a

Â . Pioneer AVNavigator (Windows) - UpdateStar.com Q: PHP mail sending multiple emails in a single request I can't find any reference to this in the PHP documentation and I'm sure it's a solved problem (as the question explains). I'm sending an email via a PHP script that looks like this (it's a stand-alone script that requires no databases). \$message = "\$body. "; \$headers = "MIME-Version: 1.0\r\n". "Content-type: text/html; charset=UTF-8\r\n". "From: me@mydomain.com". "\r\n"; \$headers.= "Cc: info@domain.com, info@domain2.com"; \$headers.= "Bcc: support@domain.com, support@domain2.com"; \$headers.= "Return-Path: me@domain.com"; \$sent = @mail(\$recipient, \$subject, \$message, \$headers); echo \$sent; There are multiple senders and multiple recipients. It works perfectly, however I have 2 or more of these scripts running at once, and it seems like they're overwriting each other (i.e. the message to be sent is the last one processed by one of the scripts). Is there a way around this? A: You have at least 2 potential issues with your code: You are setting \$headers after \$message. It should look like this: \$headers = "MIME-Version: 1.0\r\n". "Content-type: text/html; charset=UTF-8\r\n". "From: me@mydomain.com". "\r\n"; \$headers.= "Cc: info@domain.com, info@domain2.com"; \$headers.= "Bcc: support@domain.com, support@domain2.com"; \$headers.= "Return-Path: me@domain.com"; \$sent = @mail(\$recipient, \$subject, \$message, \$headers); echo \$sent; You are attempting to mail multiple recipients with the same \$headers. You should use multiple addresses
