How AutoCAD started AutoCAD started as an in-house software design tool for the architects and engineers at Bellcore, a research and development division of AT&T. The software was developed by Larry Robinson and a small team from Bellcore that included programmers, artists, and CAD professionals.

History of AutoCAD December 1982 AutoCAD is

launched on Bellcore's first microcomputer platform, the CP/M based Motorola 6809 family. The company makes the first implementation of the early ANSI CAD standard as the basis for the 2.0 product. This standard is commonly referred to as the Bellcore CAD Standard. 1984

Category:AutoCADSurface mounted electronic components such as capacitors have been used extensively in many applications. Capacitors can be included in such devices as integrated circuits. Such capacitors are provided in a variety of sizes and shapes depending on the type of devices in which they are to be used. Capacitors are usually made of electrically conducting metal such as aluminum, tantalum, or other suitable conducting metals. The metal is deposited on a substrate of insulating material. Once the metal is deposited, it is etched and oxidized to form the finished capacitor.

FIGS. 1 and 2 illustrate a typical conventional process for fabricating a capacitor. An aluminum or other suitable metal layer 10 is deposited on a substrate

12. Once the aluminum layer 10 is deposited, it is often subjected to a "shaping" step that causes the aluminum to assume the shape of the desired finished capacitor. Shaping is typically achieved by etching the aluminum layer 10 until the metal layer 10 is depressed into a cavity or indentation in the substrate 12. Typically, the cavity in the substrate is etched by dry etching using oxygen and/or an oxygen containing gas. The typical process is carried out at an elevated temperature. Typically the temperature is approximately 250.degree. C. An oxidizing agent is used to carry out the etch process. Suitable oxidizing agents are oxygen and/or an oxygen containing gas. The shaped aluminum layer is then subjected to a second etch process that removes the material from the substrate 12 except where it is to

remain as the finished capacitor. In the second etch process, the aluminum layer 10 is etched with a mixture of sulfuric acid and nitric acid or a similar etchant. The first etch step is typically referred to as the etch front forming step and the second et ca3bfb1094
