Accessing Photomerge: This article shows you how to create a unique panorama. Using Photoshop's built-in actions, such as trim, crop, rotate, warp, and blend, as

well as the Photoshop Elements plugins, gives you the power to create stunning images with ease. # Adjusting a photos density Photoshop can change the overall density of an image, giving you more control over the content of a photo. In Figure 4-6, for example, I've used the Adjust ► Levels command to increase the brightness and decrease the overall darkness of a photo. You can see a visible difference in the photo at the lower left. My goal is to create a photographic illusion to show the difference between a wrapped canvas and a straight canvas at the lower right. FIGURE 4-6: Use the Levels command to adjust the density of an image. ## Working with Images When you open an image, Photoshop displays it in a preview window, as shown in Figure 4-7. You can use the rectangle in the upper-right corner of the screen to zoom in, drag, and rotate the image. The ellipse

to the left of the image shows the alpha channel (also called the `_mask layer_`). You may see other layers in the layer panel as well. FIGURE 4-7: The image shown in the preview window is available in the photo bucket or on your computer. The following sections explain how to use Photoshop's main tools, such as the Crop tool, to add objects to an image and delete objects or portions of an image. These tools are available in the toolbox on the right side of the window. You can also access the Crop tool by choosing it from the Crop panel in the photo area, as shown in Figure 4-8. FIGURE 4-8: The Crop tool also appears in the Crop panel.

Q: JPA Interface method casting I have two entities, EntityA and EntityB. EntityB has a public getter and setter for some name property of EntityA. I have exposed a JPA-style interface for EntityA with a public getName and setName method. I have a unit test that instantiates EntityA with the test data, gets the value of the entity and uses setName to set a field in EntityA to the value of the method getName. I would expect this to work fine, but instead I get an exception saying that the setName is undefined. I've had similar issues before.

At the time it was because I was using StAX, but I'm wondering if this time the problem is the casting. Here's the relevant code: public interface EntityA { } public interface EntityB { public EntityA getEntityA(); } Then, in my test: @Test public void testAction() {
